AI Usage Log

Tools used

- **Claude (Anthropic)** — data exploration planning, drafting the engine/flow code, writing the memo, and sanity-checking the economics.
- **An LLM inside the product itself** — the address/name judgment step (`engine/llm_check.py`), designed to run on an offline deterministic mock by default and a real model (e.g. GPT-4o-mini) when an API key is set.

What I used AI for

- Scaffolding the config-driven engine and the WhatsApp flow quickly.
- Turning raw EDA numbers into a plain-English founder memo.
- Pressure-testing the "should we cancel?" economics argument.

3 times the AI was wrong or weak, and how I caught it

1. AI first suggested cancelling all high-risk COD orders. When I described the problem, the initial AI framing leaned toward "cancel risky orders to save RTO cost" — echoing the Head of Ops. I caught it by actually computing the expected value: a delivered order (+₹402) massively outweighs a return (−₹169), so break-even is ~70% RTO, not something low. **Fix:** I made "don't cancel; confirm/nudge instead" the core recommendation, backed by the maths.

2. AI proposed pincode-level risk scoring. It sounded precise and I nearly used it. **Caught it** by checking row counts: only one pincode had ≥8 orders, so pincode rates would be noise. **Fix:** dropped to state-level risk, which has enough volume to be reliable, and left pincode as an optional override.

3. AI's first threshold values looked reasonable but lost money. The initially suggested bands (35/55/75) seemed sensible, but when I backtested, the hold bucket was only ~60% RTO and the policy *lost* ₹887 by cancelling genuine orders. **Caught it** by measuring actual RTO rate inside each bucket rather than trusting the numbers. **Fix:** swept thresholds against real data and breakeven economics, landing on 20/45/85 so the hold bucket is ~100% RTO.

Where I deliberately did NOT trust AI

- The final money figures were computed in code from the real CSV, not estimated by an LLM.
- Phone/name/geo checks are deterministic code, not AI, so results are reproducible and free.
